RBloomberg Manual

Ana Nelson

June 24, 2009

1 About RBloomberg

RBloomberg is an R package which handles fetching data from the Bloomberg financial data application. RBloomberg was written by Robert Sams, see the package README for additional contributors and acknowledgements. RBloomberg is released under a GPL open source license.

To download the latest version of this document, please visit the RBloomberg home page.

2 Installation and Requirements

2.1 Installation

RBloomberg will only work on a Bloomberg workstation, using the Desktop COM API. This version requires the rcom R package, which in turn depends on statconnDCOM which is a COM server that, while free, is not open source. Support for the Bloomberg Version 3 Java API is in development. When rcom is installed, it will give instructions on how to install statconnDCOM. If you install RBloomberg via

```
install.packages("RBloomberg", repos="http://R-Forge.R-project.org")
```

then rcom will automatically be installed for you if you don't have it.

2.2 Hello, World

Once you have RBloomberg installed, load the library just like any other via:

```
1  library(RBloomberg)
```

The first order of business is to connect to the Bloomberg data application, and store a reference to this connection object. You will use this in all subsequent calls:

```
2  conn <- blpConnect()
```

Then we can make a simple request to ensure that the connection is working:

```
3  blpGetData(conn, "RYA ID Equity", "NAME")
```

The result of running these three commands should be something like this:

```
1  > library(RBloomberg)
2  Loading required package: rcom
3  Loading required package: rscproxy
4  Loading required package: zoo
5
6  Attaching package: 'zoo'
7
8
```

```
 9          The following object(s) are masked from package:base :

10

11           as.Date.numeric

12

13  Loading required package: bitops
14  Loading required package: RUnit
15  Contents of bbfields have been stored in .bbfields in the current workspace
16  Contents of bbfields.ovr have been stored in .ovr in the current workspace
17  > conn <- blpConnect()
18  > blpGetData(conn, "RYA ID Equity", "NAME")
19                                 NAME
20  RYA ID EQUITY RYANAIR HOLDINGS PLC
21  >
```

2.3 Unit Tests

Tests are live code examples that are tested for the expected output. They are useful to developers as a code quality tool, and they can also be very useful to users to help ensure everything is running smoothly and also as an extra source of reference material. Should you not be able to find the information you need in formal documentation (this is general advice, not just pertaining to RBloomberg), look for tests and study the syntax of examples there.

To ensure that everything is running smoothly, we recommend that you run the RUnit test suite:

```
2  testResults <- runTestSuite(allBloombergTests)
3  printTextProtocol(testResults)
```

The output of printTextProtocol should look like this:

```
1  RUNIT TEST PROTOCOL -- Wed Jun 24 10:47:12 2009
2  ***********************************************
3  Number of test functions: 14
4  Number of errors: 0
5  Number of failures: 0
6
7
8  1 Test Suite :
9  All Tests - 14 test functions, 0 errors, 0 failures
10
11
12
13  Details
14  ***************************
15  Test Suite: All Tests
16  Test function regexp: ^test.+
17  Test file regexp: Test.R$
18  Involved directory:
19  C:/DOCUME~1/nelsona/LOCALS~1/Temp/Rinst21292065/RBloomberg/runit-tests
20  --------------------------
21  Test file: C:/DOCUME~1/nelsona/LOCALS~1/Temp/Rinst21292065/RBloomberg/runit-tests/blpGetDataTest.R
22  test.basic: (2 checks) ... OK (1.89 seconds)
23  test.overrides: (9 checks) ... OK (4.74 seconds)
24  --------------------------
25  Test file: C:/DOCUME~1/nelsona/LOCALS~1/Temp/Rinst21292065/RBloomberg/runit-tests/blpToolsTest.R
26  test.category.name: (1 checks) ... OK (0.03 seconds)
27  test.data.type.for.list.of.fields: (1 checks) ... OK (0.01 seconds)
28  test.data.type.for.single.field: (1 checks) ... OK (0 seconds)
29  test.field.info.raises.error.on.invalid.mnemonic: (1 checks) ... OK (0.02 seconds)
```

```
30  test.field.name.for.list.of.fields: (1 checks) ... OK (0.03 seconds)
31  test.field.name.for.single.field: (1 checks) ... OK (0 seconds)
32  test.historical: (1 checks) ... OK (0.01 seconds)
33  test.is.power.of.two: (4 checks) ... OK (0 seconds)
34  test.static: (1 checks) ... OK (0 seconds)
35  test.what.i.override: (2 checks) ... OK (0.01 seconds)
36  test.what.overides.me: (2 checks) ... OK (0.03 seconds)
37  --------------------------
38  Test file: C:/DOCUME~1/nelsona/LOCALS~1/Temp/Rinst21292065/RBloomberg/runit-tests/rcomBloombergTest.
39  test.bloomberg: (3 checks) ... OK (2.67 seconds)
```

In particular, take note of any errors or failures. Hopefully you will have none of either.

3 Getting Current Data

This section covers getting current, i.e. non-historical, data from Bloomberg. This may be live (or delayed as per your availability) market data, or static descriptive data.

Note that the fields employed here are the same fields you may be familiar with using the Excel add-in, and the FLDS function within your Bloomberg terminal is a convenient way to search for fields.

3.1 Basic Calls

You have already seen the simplest type of call you can make. At minimum we need to pass a connection object, a single ticker, and a single field.

```
5  blpGetData(conn, "RYA ID Equity", "PX_LAST")
```

This can be expanded by passing vectors of tickers and/or fields, to obtain data on multiple securities at once, or to return multiple fields at once, or both.

```
6  blpGetData(conn, c("IBM US Equity", "MSFT US Equity"), c("NAME", "PX_LAST"))
```

And, of course, you can pass these arguments by way of variables, just as you might for any other R function:

```
7  securities <- "ED1 Comdty"
8  fields <- c("NAME", "PX_LAST", "OPEN")
9  blpGetData(conn, securities, fields)
```

The data returned from these calls will look something like this:

```
1               PX_LAST
2  RYA ID EQUITY     3.28
3                                        NAME PX_LAST
4  IBM US EQUITY  INTL BUSINESS MACHINES CORP  104.44
5  MSFT US EQUITY                MICROSOFT CORP   23.34
6                                   NAME PX_LAST    OPEN
7  ED1 COMDTY Generic 1st 'ED' Future  99.265 99.275
```

3.2 Using Overrides

The Bloomberg API allows you to make certain overrides to change the value that a function returns. We give a few examples here, to determine whether a field you wish to request can be overridden, consult the FLDS screen in your Bloomberg terminal (look for What Overrides Me), or use the what.overrides.me() function discussed below to look up overrides within R.

A common use for overrides is to return data in a currency other than the security's default currency.

```
5  blpGetData(conn, "RYA ID Equity", "PX_LAST")
6  blpGetData(conn, "RYA ID Equity", "CRNCY_ADJ_PX_LAST")
7
8  blpGetData(conn, "RYA ID Equity", "CRNCY_ADJ_PX_LAST",
9      override_fields = "EQY_FUND_CRNCY", overrides = "HKD")
10
11 blpGetData(conn, "RYA ID Equity", "CRNCY_ADJ_PX_LAST",
12      override_fields = "EQY_FUND_CRNCY", overrides = "GBP")
```

```
1               PX_LAST
2  RYA ID EQUITY    3.28
3               CRNCY_ADJ_PX_LAST
4  RYA ID EQUITY              3.28
5               CRNCY_ADJ_PX_LAST
6  RYA ID EQUITY          35.87086
7               CRNCY_ADJ_PX_LAST
8  RYA ID EQUITY          2.788618
```

Another very useful function involving overrides is the Custom Total Return family of calls. We can first use some of the helper functions to find the tickers by searching the list of available mnemonics, and to determine which overrides are available and which fields they apply to.

```
17 cat("search all mnemonics to find all with CUST_TRR\n")
18 search.mnemonics("CUST_TRR")
19
20 cat("find out which fields override CUST_TRR_RETURN\n")
21 what.overrides.me("CUST_TRR_RETURN")
22
23 cat("find our which fields are overridden by CUST_TRR_CRNCY\n")
24 what.i.override("CUST_TRR_CRNCY")
```

```
1  search all mnemonics to find all with CUST_TRR
2  [1] "CUST_TRR_CRNCY"            "CUST_TRR_DVD_TYP"
3  [3] "CUST_TRR_END_DT"           "CUST_TRR_RETURN"
4  [5] "CUST_TRR_RETURN_ANNUALIZED"  "CUST_TRR_RETURN_HOLDING_PER"
5  [7] "CUST_TRR_START_DT"
6  find out which fields override CUST_TRR_RETURN
7  [1] "CUST_TRR_DVD_TYP"  "CUST_TRR_START_DT" "CUST_TRR_END_DT"
8  [4] "CUST_TRR_CRNCY"
9  find our which fields are overridden by CUST_TRR_CRNCY
10 [1] "CUST_TRR_RETURN_ANNUALIZED"  "CUST_TRR_RETURN_HOLDING_PER"
```

Once we know the fields, we can construct our call to fetch the desired data:

```
28 blpGetData(conn, "MSFT US Equity", c("CUST_TRR_RETURN"),
29      override_fields = c("CUST_TRR_START_DT", "CUST_TRR_END_DT"),
30      overrides = c("20080215", "20080602")
31 )
32
33 blpGetData(conn, "MSFT US Equity",
34      c("CUST_TRR_RETURN"),
35      override_fields = c("CUST_TRR_START_DT", "CUST_TRR_END_DT", "CUST_TRR_CRNCY"),
36      overrides = c("20080215", "20080602", "GBP")
37 )
```

```
1               CUST_TRR_RETURN
2  MSFT US EQUITY          -4.7736
3               CUST_TRR_RETURN
4  MSFT US EQUITY          -5.9796
```

As you can see from this example, it is possible to specify multiple overrides in a single request. Take care to list the overrides in corresponding order to the fields passed to override_fields.

4   Field Information

There are a number of utility methods within RBloomberg to help you identify fields available for calling. These were touched on in Section 3.2 discussing overrides. Note that at this time, these fields rely on local information stored in .ovr and .bbfields and so can be used without making a connection to Bloomberg. As the next generation API has support for live field information, however, this will not always be the case.

4.1   Field Mnemonics

Mnemonics are what we typically think of as field names such as PX_LAST or NAME. You can research available mnemonics within your Bloomberg terminal using the FLDS function, and you may find this the most convenient way to search.

To search (using grep) for all mnemonics matching a certain pattern, try:

```
4  search.mnemonics("PX_LAST")
```

```
1   [1] "CRNCY_ADJ_PX_LAST"              "MTG_GEN_PX_LAST_UPDATE"
2   [3] "PROV_PX_LAST"                   "PX_LAST"
3   [5] "PX_LAST_ACTUAL"                 "PX_LAST_ALL_SESSIONS"
4   [7] "PX_LAST_AM"                     "PX_LAST_ARROW_ALL_SESSION"
5   [9] "PX_LAST_AT_LONDON"              "PX_LAST_BOTH"
6  [11] "PX_LAST_ELEC"                   "PX_LAST_EURO"
7  [13] "PX_LAST_EVENING_PRICE_HELSINKI" "PX_LAST_EVENING_TRADE_HELSINKI"
8  [15] "PX_LAST_EXCH_CODE"              "PX_LAST_FORM_T"
9  [17] "PX_LAST_INDIA"                  "PX_LAST_ITALY"
10 [19] "PX_LAST_LEGACY"                 "PX_LAST_LONDON"
11 [21] "PX_LAST_PM"                     "PX_LAST_POST_SESSION"
12 [23] "PX_LAST_PRE_SESSION"
```

Once you know the mnemonic you wish to use, you can get more information about it like this:

```
8  field.info("PX_LAST")
```

```
1         category category.name subcategory subcategory.name field.id field.name
2  12719       195       Pricing           0               NA     0560 Last Price
3         field.mnemonic mkt.bitmask data.bitmask data.type
4  12719         PX_LAST        4062           12         3
```

5   Historical Data
